

Synchrony Analytics Hackathon 2026 – Case Study

This document outlines the Synchrony Analytics Hackathon 2026 case study focused on customer analytics, silent attrition, and declining share of wallet. It includes the business background, analysis requirements, key considerations, and submission instructions.

Case Study Overview

Synchrony Analytics Hackathon 2026 – Case Study

Theme: Customer and Credit Card Analytics – Silent Attrition/Declining Share of Wallet

This case study focuses on analyzing MetroMart Inc. and HSIC card transaction data to identify customers with declining share of wallet and design strategies to increase usage of the MetroMart–HSIC co-branded credit card.

Background

MetroMart Inc. has partnered with HSIC Bank to launch a co-branded credit card that offers rewards and financing options. Reward rates differ based on Prime membership status when customers shop at MetroMart Inc.

- Prime members: 5% cashback on grocery purchases, 3% cashback on electronics purchases, and 1% cashback on all other eligible purchases at MetroMart Inc.
- Non-Prime members: 1% cashback on all purchases at MetroMart Inc.

Business Problem and Expected Outcome

Although many customers hold the MetroMart–HSIC co-branded credit card, HSIC leadership believes spend on MetroMart Inc. using this card is declining. Customers may be shifting their spend to other payment methods such as competitor cards, cash, or wallets, reducing HSIC's Share of Wallet (SoW) on MetroMart Inc.

- Analyze two years of combined MetroMart Inc. and HSIC card transaction data.
- Uncover customer insights related to silent attrition and declining share of wallet.
- Develop customer segments using a model or method to identify low share-of-wallet customers.
- Create targeted offers and rewards to increase usage of the MetroMart–HSIC co-branded credit card at MetroMart Inc.

Key Considerations for Analysis

- Share of Wallet is defined as the proportion of a customer's total spend at MetroMart Inc. that is transacted on the HSIC co-branded card: $\text{SoW} = (\text{Spend on HSIC card at MetroMart}) / (\text{Total spend by HSIC cardholder at MetroMart})$.
- SoW should be computed only for the period during which the customer held an active/open HSIC card.

- The MetroMart-HSIC co-branded card currently offers the most competitive reward rates on MetroMart Inc. for Grocery and Electronics purchases. No competing credit or debit card in the market matches these rates on the two categories.
- Rewards earned in a given month are credited as a statement adjustment in the following month's billing cycle.
- There are no joining or annual fees for the MetroMart-HSIC co-branded card.
- SoW must be calculated on net sales, not gross sales.
- Number of transactions should be considered zero for returns in the data.
- MetroMart Inc.'s fiscal year runs August through July.
- Shopping categories can be determined from the Category Code table using Category_Code as the primary key.
- Transaction payment methods can be identified from the Payment Code table using Payment_Code as the primary key.
- Clearly state all assumptions made during the analysis.

Submission Instructions

- Please submit your findings and analysis as **Slides in PDF format** to analyticshiring@syf.com by 12:00 PM IST on 13th September . Do not upload on Google Drive
- **The email subject line should only have the student roll number.**
